

AA-1240 Technical Data Sheet

AA-1240

AA-1240 is an alkaline, liquid concentrate compound used primarily for refinement and polishing aluminum vibratory applications.

Physical Properties:

Appearance, Clear Transparent liquid.
(pH 13.4 – 13.7)

Typical Application

Removal of forming lines and polishing; The most effective process should be selected based on performance testing in full production conditions. AA-1240 can be used with a wide range of tumbling medias including plastic, porcelain, ceramic and steel. Polishing results vary according to the media being used.

AA-1240 provides moderate rust inhibition on ferrous metals. This eliminates the need to rust inhibit steel media for a few days depending on your facility environment.

Typical Process

AA-1240 is supplied as a concentrated liquid. The product is diluted in water at a concentration of 2-4%. This solution is then added to the vibratory machine at a flow rate of 1 to 2 gallons per hour per cubic foot of machine capacity. Cycle times will vary depending on the condition of the workpiece prior to processing and the media selection.
